Voorwoord

Opdrachtgevers en organisatoren, alsmede gemeentelijke diensten hebben behoefte aan handvatten voor de beoordeling van kwaliteit en specificaties van overdekte podia die tijdelijk geplaatst worden. Met als doel het inzichtelijk krijgen van waar gehuurde overdekte podia aan moeten voldoen op gebied van onder meer brandveiligheid- en constructieve veiligheid. Een van de is om een podiumboek op te stellen waarin deze zaken overzichtelijk en begrijpelijk worden weergegeven, dit op een vergelijkbare manier hoe een tentboek wordt samengesteld.

In het veld worden diverse termen gebruikt voor het overdekken van een podium; kap, dak, stage, overkapping. In essentie betreft het in dit bouwboek een podium wat voorzien is van een constructie welke zorgdraagt voor (gedeeltelijke) beschutting van de elementen.

In de bijlagen komen zaken aan de orde als tekeningen, kwaliteitsverklaringen, constructieve berekenen en andere informatie welke verder relevant is.

In de normen welke gaan over de overdekte podia worden kwaliteitsverklaringen, constructieve berekeningen en andere relevante stukken genoemd. Hierin staat gesteld dat deze stukken niet in de Nederlandse taal opgesteld hoeven te zijn, eventuele aanvullende toelichtingen en handleidingen wel. Het voorwoord en handleidingen die minimaal in het podium-boek moeten staan worden gezien als toelichting. Andere zaken dan de toelichting(en) in het podium-boek mogen in het Duits, Frans of Engels aangeleverd worden.

Het gebruik van het overdekte podium is geen onderwerp van het podium-boek.

Binnen het NEN lopen nog een aantal andere trajecten die te maken hebben met evenementen, allemaal beginnende met: 8020-

Een aantal, al dan niet Europese, algemeen gehanteerde normen en richtlijnen die te maken hebben met overdekte podia welke tijdelijk geplaatst worden zijn o.a.:

- NPR 8020-50 Evenementen – Podiumconstructies – Verantwoordelijkheden
- NPR 8020-51 Evenementen – Podiumconstructies – Belastingen en constructieve uitgangspunten
- NEN-EN 13814 Machines en constructies op kermisterreinen en amusementsparken – Veiligheid
- NEN-EN 1990 Grondslagen van het constructief ontwerp
- NEN-EN 1991 Belastingen op constructies
- NEN-EN 1993 Staalconstructies

Bovenstaande normen- en richtlijnen refereren o.a. aan de Eurocodes NEN-EN 1991-1-4/NB;

Deel 1: Belastingen op constructies

Deel 1-4: Algemene belastingen – Windbelasting.

Een tijdelijk geplaatst overdekt podium is in beginsel geen bouwwerk in de zin van het bouwbesluit. Hieruit voortvloeiende kan er daarom niet automatisch naar het bouwbesluit of andere zaken worden gekeken als het gaat om beoordeling van een tijdelijk geplaatst overdekt podium. Hier moeten dus ook de eerder genoemde normen- en richtlijnen naast gehouden worden.

Keuringsrapporten voor zeil, bijvoorbeeld bepaald volgens B1 of M1, zijn doorgaans voorzien van een geldigheidsdatum. Deze datum heeft alleen betrekking op het productieproces van het zeil en niet op het product. Het zegt niets over het (brand)verloop van de kwaliteit van het materiaal. Zeil dat voldoet aan de gestelde eisen blijft zelfdovend. Dit gegeven is mede onderschreven door het LNB, cluster brandveilig gebruik.

Overdekte podia zijn onder te verdelen in:

- (gedeeltelijk) met zijwanden van harde panelen of zeil
- zonder zijwanden
- voorzien van meer bouwlagen

Het gebruik van dit podium-boek is slechts voorbehouden aan Eekels Verhuur B.V..

1. Algemene informatie

In dit hoofdstuk worden alle gegevens van de fabrikant en algemene gegevens overdekte podia indien deze buiten Europa is geproduceerd, tevens naam van importeur.

1.1 Algemene gegevens fabrikant(en);

Zeil	POLYMAR – FR COLOR 700
Constructie	LEAF
Type zeil	PVC; artikel 8509 5240

1.2 Algemene gegevens;

Naam	LEAF
Type	DJ Covering
Configuratie(s)	6.21x4.14 meter

2 Gegevens verhuurder of leverancier

Hieronder wordt alle huidige en relevante informatie weergegeven van de verhuurder/leverancier.

Rechtsvorm	Besloten Vennootschap
Handelsnaam	Eekels Verhuur B.V.
Bezoekadres	Hallenstraat 20 5531 AB BLADEL
Postadres	P.O. Box 175 5530 AD BLADEL
Telefoonnummer	0031 73 6136867
Website	www.eekelsverhuur.nl
Mailadres	info@eekelsverhuur.nl
K.v.K. nummer	84151722
Omzetbelasting nummer	NL863114192B01
Bank	Rabobank de Kempen
IBAN Rekening nummer	NL43RABO0374476608
BIC	RABONL2U

3 Algemene technische gegevens van de overdekte podia

Waar dient de huurder ten alle tijden rekening mee te houden bij de ingebruikname van het overdekte podium.

3.1 Algemeen

- Geen sneeuw- en/of hagelbelasting gerekend
- Podiumvloer is geschikt voor een belasting tot 750 kg/m²
- Obstakels moeten ten minste 0,5 meter van het doek verwijderd zijn (zowel binnen als buiten).

3.2 Bijzonderheden

Voor de berekeningen is aangehouden:

- Onbebouwde omgeving;
- Tekeningen volgens het bouwboek;
- Toetsing volgens NEN-EN 13814;
- Afmeting van de constructie: 6.21x4.14 meter

4 Basis instandhouding- en ontruimingsprotocol

Er zijn zaken welke in basis ten alle tijden van toepassing zijn bij een overdekt podium.

- De constructie van de overdekte podia mogen na oplevering nooit zo worden aangetast dat de constructieve veiligheid in het geding komt.
- Organisator moet grondankers, ballast, windverbanden, spanbanden, palen, wandpanelen, zeilen of andere zaken na losmaken voor welk doel dan ook direct weer terugplaatsen/vastmaken.
- Bij het verlaten van het terrein en/of afsluiten van dagelijkse werkzaamheden en/of na afloop van het evenement moet organisator waar mogelijk de toegang tot het overdekte podia sluiten of niet toegankelijk maken.
- Het overdekte podia moet(en) te allen tijde door organisator sneeuw- en of hagelvrij gehouden worden.
- Cumulatie van water, z.g. waterzakken, moeten door organisator direct verwijderd worden, indien dit niet lukt moet verhuurder meteen verwittigd worden.
- Eventuele loskomende grondverankering of verschuivende ballast moet door organisator direct gemeld worden aan verhuurder.
- Voor opgave gemiddelde wind in Bft. en windstoten. (piekwind) in relatie tot de grenswaarden, het sluiten of buiten gebruik stellen van het overdekte podium zie windtabel(len) elders in dit stuk. Daarbij dienen de beheersmaatregelen uit bijlage 4 in acht genomen te worden.
- Equipotentiaalverbinding. Al het blootliggende metaalwerk binnen een structuur dat in contact zou kunnen komen met een bron van elektrische stroom moet op adequate wijze geaard zijn. Er moet rekening worden gehouden met de mate van blootstelling en het risico op blikseminslag en, waar van toepassing, moet de constructie voldoende worden beschermd. Advies over verlichtingsniveaus voor normaal en noodgebruik valt buiten het toepassingsgebied van deze norm en is elders beschikbaar.
- Blikseminslag in de constructie die voldoet aan gestelde (brandveiligheidseisen levert geen schade op aan de overdekte podia).
- Bij acute dreiging van zwaar onweer gepaard gaande met z.g. valwind en/of hagel moet het overdekte podium en directe omgeving ontruimd-, en indien mogelijk gesloten worden. Het overdekte podium is hierin van ondergeschikt belang.
- Organisator moet het lokale weer tijdens het evenement adequaat bewaken en actie ondernemen waar eigen organisatieprotocollen of overdekte podiumspecificaties dit aangeven.

5 Verklaring weeromstandigheden

Met welke weersomstandigheden dient de huurder rekening te houden.

- Een constructie wordt berekend op een stuwdruk (de windbelasting per m²). De stuwdruk ontstaat door de windsnelheid. De windsnelheid is opgebouwd uit een stationair deel en een turbulent deel. Hierdoor ontstaan er pieken in de windsnelheid.
- Windsnelheid wordt standaard gemeten op 10 meter hoogte in het vrije veld, zonder obstakels. Er kan gesproken worden over een piekwindsnelheid, een 10-minuten gemiddelde windsnelheid of een uurgemiddelde windsnelheid. Hoe langer de tijd is, hoe lager het gemiddelde.
- De in de berekeningen gehanteerde beaufort-windschaal wordt in Nederland weergegeven in een 10-minuten **gemiddelde windsnelheid** op 10 meter hoogte in het vrije veld.
- **De stuwdruk waarop een overkapping berekend is, is bepalend voor de sterkte van de overkapping. Het gaat er dus om dat op de juiste manier wordt vastgesteld welke windsnelheid moet worden aangehouden om te kunnen bepalen of de stuwdruk overschreden wordt.**
- Als er niet op locatie gemeten wordt, moet gebruik worden gemaakt van de dichtstbijzijnde meteostation en moet de 10-minuten-gemiddelde windsnelheid op 10 meter hoogte worden opgevraagd. Als de grens-10 minutengemiddelde snelheid wordt bereikt, is de grens-stuwdruk bereikt. De opgegeven waarden gelden voor onbebouwd terrein (buiten de bebouwde kom) en niet voor het strand.
- Onderscheid tussen gemiddelde- en piekwindsnelheid in acht nemen.

De windkracht volgens de Schaal van Beaufort (bron: KNMI). De schaal van Beaufort wordt gebruikt voor de gemiddelde windsnelheid, over minstens 10 minuten gemeten, niet voor de snelheid van rukwinden/windstoten(piekwind).

Kracht	Benaming van KNMI	Benaming in Zeevaart	Snelheid in km/h*	Snelheid in m/s*	Snelheid in knopen
0	Stil	Windstil	0-1	0-0,2	0-1
1	Zwak	Flauw en stil	1-5	0,3-1,5	1-3
2	Zwak	Flauwe koelte	6-11	1,6-3,3	4-6
3	Matig	Lichte koelte	12-19	3,4-5,4	7-10
4	Matig	Matige koelte	20-28	5,5-7,9	11-16
5	Vrij krachtig	Frisse bries	29-38	8,0-10,7	17-21
6	Vrij krachtig	Stijve bries	39-49	10,8-13,8	22-27
7	Hard	Harde wind	50-61	13,9-17,1	28-33
8	Stormachtig		62-74	17,2-20,7	34-40
9	Storm		75-88	20,8-24,4	41-47
10	Zware storm		89-102	24,5-28,4	48-55
11	Zeer zware storm / orkaanachtig		103-117	28,5-32,6	56-63
12	Orkaan		>117	>32,7	>63

De Nederlandse weerstations onder andere vinden op: www.meteovista.nl, www.knmi.nl, www.meteoconsult.nl en www.meteostation.nl.

Organisator kan ook bij onder andere Meteovista en Meteoconsult gedurende de duur van het evenement een weerbewakingscontract aangaan om nog beter op de hoogte te zijn van de lokale weersomstandigheden.

9 Bijlage IV: Beheersmaatregelen (WMP; Wind Management Plan)

In dit Beheersplan wordt kort omschreven welke stappen bij welke windsnelheid gezet dienen te worden. De waarde waarbij deze stappen gezet dienen te worden verschillen per windgebied.

Hieronder een opsomming van de 10-minuten gemiddelde windsnelheid per locatie (omschreven in de NEN-EN 1991-1-4:2005)

In de bovenstaande hoofdstukken is uitgelegd hoe de berekening is opgebouwd. Conform de Geldende normen dient dan het onderstaande Beheersingsplan toegepast te worden.

1. Dakzeil dient verwijderd te zijn bij het bereiken van onderstaande waarde;

Gebied	10 minuten gemiddelde windsnelheid (m/s)	Beaufort (Bft)	Piekwindsnelheid (m/s)	Stuwdruk (kN/m ²)
Kust	10.58	5	17.89	0.20 kN/m ²
Onbebouwd	12.03	6	17.89	0.20 kN/m ²
Bebouwd	17.57	7	17.89	0.20 kN/m ²

2. Het podium dient UIT-SERVICE (out-service) gesteld te zijn bij het bereiken van onderstaande waarde;
- Tevens dient de directe omgeving ontruimd te zijn

Gebied	10 minuten gemiddelde windsnelheid (m/s)	Beaufort (Bft)	Piekwindsnelheid (m/s)	Stuwdruk (kN/m ²)
Kust	15.65	7	26.46	0.4375 kN/m ²
Onbebouwd	17.79	8	26.46	0.4375 kN/m ²
Bebouwd	25.99	9	26.46	0.4375 kN/m ²

3. Bij acute dreiging van zwaar onweer gepaard gaande met z.g. valwind en/of hagel moet de constructie en directe omgeving ontruimd-, en indien mogelijk, gesloten worden. De overkapping is hierin van ondergeschikt belang.

NOTE; de 10-minuten gemiddelde windsnelheid wordt alleen weergegeven als referentie windsnelheid. Acties omtrent de constructie dienen ondernomen te worden aan de hand van de piekwindsnelheid.

Bij vragen of twijfel over dit plan kunt u altijd contact opnemen met Eekels Verhuur B.V.

Annex: S41 Truss information

1 General Preliminary notes.

1.1 Project description.

This project concerns the structural calculation of a special DJ roof designed for Eekels Verhuur.

The DJ Roof has been calculated to withstand maximum wind gusts of 20m/s when the Roof canopy is attached.

The construction without the roof canopy attached can withstand wind gusts of 28 m/s.

The DJ roof exist of two S41 truss uprights with a special corner on the top. To this special corner, an arch on the front side and an arch on the back side are attached. The front arch can hinge to the front for easy assembling. The arches are constructed from special designed triangular truss. The roof fabric is a membrane which is attached with bungies to the front and back arch.

On the front and back arch there is the possibilities to suspend lightning with a maximum load of 25 kg/m.

The base of the DJ roof need to be integrated in a Layher stage which secures the stability of the system. The small Layher stage is part of the stability calculation of the construction.

The DJ roof can also be integrated in other Layher stages.

Other Layher construction are not part of this calculation and need to be calculated separately!! This because the size will always be different.

1.2 Construction drawing

1.2.1 Impression drawing DJ Roof on small stage

DRAWN BY : Ivo Mulder	PROJECT NR : 2017021	REMARKS :	UNIT : MM		Structural Event Engineering IM www.im-steel.com
DATE : 24-5-2018	CUSTOMER : Eekels Verhuur				
REVISION :	STATUS :				
DESCRIPTION :			A3		
DJ Roof 2018 On small stage					
THE INFORMATION CONTAINED IN THIS DRAWING IS THE SOLE PROPERTY OF IM STRUCTURAL EVENT ENGINEERING. ANY REPRODUCTION IN PART OR WHOLE WITHOUT THE WRITTEN PERMISSION OF IM STRUCTURAL EVENT ENGINEERING IS PROHIBITED.					

1.2.2 Impression drawing DJ Roof in front of Layher wall.

1.3 Used normalisation.

This calculation is based on the next parts of the Eurocodes.

NEN-EN 1990	(Eurocode 0) Basis of structural design.
NEN-EN 1991	(Eurocode 1) Action on structures.
NEN-EN 1993	(Eurocode 3) Design of steel structures.
NEN-EN 1999	(Eurocode 9) Design of Aluminium structures.
NEN-EN 13814	Fair ground and amusement park machinery and structures
NEN-EN 13782	Temporary Structures-Tents-Safety.
NEN-EN 12385	Steel wire ropes.

1.4 General load assumption explanation.

The loads which are taken into account in this calculation are based on the information gathered from the different parts of the Eurocodes. Some of the loading information's from the Eurocode are based on permanent building constructions which makes it not feasible to use this information for a temporary demountable construction. In these specific cases there will be an explanation of a well weighted decision why the calculation deviates from the information presented in the Eurocode.

1.5 Used materials.

The roof construction is built from special aluminium truss Produced by Interat T.C..

The stage floor and uprights are constructed from the Layher scaffolding system.

1.6 Load assumptions

1.6.1 Wind loading

According to the Eurocode NEN-EN 13814, two wind situation calculations can be made for a temporary demountable structure. The first situation has a wind speed from 0 to 20 m/s and is called the in-service situation and the second situation has a wind speed from 20 m/s to 28 m/s and is called the out-service situation. These maximum wind speeds are the maximum wind gust measured at 10 meters high in a free environment. The In-service situation is the situation where the construction can be used for events. In this situation the roof canopy and scenery objects can be mounted to the construction. There is no danger concerning the structural integrity of the temporary demountable structure. Before the wind gust exceeds the maximum in-service wind speed of 20 m/s the roof canopy and all big scenery objects need to be removed, so the wind can pass through the construction. All these actions, and how they are executed need to be written in a method statement. When all the actions are finished the out-service situation is in place. In the out-service situation the only people who can be in the neighbourhood of the stage are professionals who know and understand the risk involved in temporary demountable structures and are well aware of the method statement. When there are wind gusts higher than the 28 m/s the construction side need to be completely cleared from all people.

The values of the extreme thrust are based on area's which have a reference wind speed of $V_{b,o}$, less or equal to 28 m/s with a return period of 5 years according to the NEN-EN 13814. If the construction will be used in an area which requires a higher extreme thrust, the user need to be aware that using the same extreme thrust value the return period will be less than 5 years.

In the NEN-EN 1991 there are 4 different terrain categories determined. In the tables on the next pages the maximum wind gust is presented which the construction can withstand in the in-service and the out-service situations, in conjunction with the height and the terrain category. The figure in the column with the head V_b in m/s is the mean wind velocity measured on 10m height in the concerning terrain category, it is recommended to use a professional weather station near to the place where the construction is build. The column with the head Max. wind gust is the maximum peak wind which is determined from the peak wind velocity by the law of Bernoulli.

Because the maximum height of the construction with a stage of 2-meter floor level is below 8 meter, only the table from $0 < 8$ m is presented on the next page.

1.6.2 In-service situation.

The 20 m/s which is mentioned as the maximum wind gust for the in-service situation is based on an average between the wind gust of 17.89 m/s for $0 < 8$ m and the wind gust 21.91 m/s for $8 < 20$ m.

$0 < 8$ meter 0.20 kN/m²

Terrain category	V _b in m/s (1)	Max. wind gust (2)
Sea or coastal area exposed to open sea	10.58	17.89
Lakes or flat and horizontal area with negligible vegetation and without obstacles	11.02	17.89
Area with low vegetation such as grass and isolated obstacles (trees, buildings) with separations of at least 20 obstacle heights	12.03	17.89
Area with regular cover of vegetation or buildings with isolated obstacles with separations of maximum 20 obstacles heights (such as villages, suburban terrain permanent forest)	14.29	17.89
Area in which at least 15% of the surface is covered with buildings and their average heights exceeds 15 m.	17.57	17.89

1.6.3 Out-service situation.

The 28m m/s which is mentioned as the maximum wind gust for the out-service situation is based on an average between the wind gust 26.46 m/s for $0 < 8$ m and the wind gust 31.62 m/s for $8 < 20$ m.

The wind pressure which is mentioned in the table below is increased with 20 % in comparison to the Eurocode 13814. This because the factor C_{tem} , which is 0.80 is taken out of the wind pressure values. Intentionally the factor C_{tem} is applied due to the fact that protection, reinforcement and sheltering is possible. In the case of these kind of structure's this is not possible to do.

$0 < 8$ meter 0.4375 kN/m²

Terrain category	V _b in m/s (1)	Max. wind gust (2)
Sea or coastal area exposed to open sea	15.65	26.46
Lakes or flat and horizontal area with negligible vegetation and without obstacles	16.3	26.46
Area with low vegetation such as grass and isolated obstacles (trees, buildings) with separations of at least 20 obstacle heights	17.79	26.46
Area with regular cover of vegetation or buildings with isolated obstacles with separations of maximum 20 obstacles heights (such as villages, suburban terrain permanent forest)	21.14	26.46
Area in which at least 15% of the surface is covered with buildings and their average heights exceeds 15 m.	25.99	26.46

1.6.4 Membrane tension of the canopy due to wind influences.

If there is a wind pressure applied to a membrane this membrane will have reaction forces in two directions on the connection to the construction. This phenomenon is called membrane tension. And in some cases, this extra loading need to be applied.

With a dynamic loading $q=0.50 \text{ kN/m}^2$ applying an aerodynamic coefficient $C_f=0.40$ and a span of $l=5.00 \text{ m}$ a resulting membrane tension of $Z=0.80 \text{ kN/m}$ is derived.

$$Z = (Z_y^2 + Z_z^2)^{1/2} = 0.80 \text{ kN/m with}$$

$$Z_z = 0.5 * 0.4 * 5.0 / 2 = 0.50 \text{ kN/m}$$

$$Z_y = (Z^2 - Z_z^2)^{1/2} = (0.80^2 - 0.50^2)^{1/2} = 0.624$$

$$Z_y / Z_z = 0.624 / 0.50 = 1.25 = 1 / 0.8$$

This force will be generated by the program itself because the wind loading is set to a membrane.

1.6.5 Snow Loads.

Snow loads are not taken into account in this calculation. Erection of the construction is initially intended to be in appropriate weather conditions. If the construction should be built in winter season, the construction need to be reinforced or kept free from snow, the method how the structure will be kept free from snow need to be written in the method statement.

1.6.6 Live load.

In this report the maximum loading on the front and back arch of the construction is presented. These are intended to give an indication of the loading possibilities in the construction. If the actual loading of the construction deviates from these, for example when there is only 1 larger point load in the middle of the arch, an additional calculation need to be made.

1.7 Loading Configurations.

In the next chapters the live loads of the front and back arch is presented.

1.7.1 UDL Loading front arch

The loading which is taken into account in the UDL Loading setup are:

Front arch = 25 kg/m^{-1}

The total UDL loading on the front arch $\sim 300 \text{ Kg}$

1.7.2 UDL Loading Back arch

The loading which is taken into account in the UDL Loading setup are:

Front arch = 25 kg/m^{-1}

The total UDL loading on the front arch $\sim 165 \text{ Kg}$

1.8 Necessary Ballast loading.

The ballast is checked for uplift, overturning and sliding. The Layher stage which is designed as a ridged stage has been taken into account.

All permanent installed loading can be subtracted from the nearest Ballast position

The safety factor for the ballast calculation against slipping is set to 1.2 according to the NEN-EN 13814. This is based on a horizontal load which is relying on friction. For the friction coefficient the factor of 0.4 has been taken into account.

Table 3 — Coefficients of friction μ

	Wood	Steel	Concrete
Wood	0,4	0,4	0,6
Steel	0,4	0,1	0,2
Concrete	0,6	0,2	0,5
Clay ^a	0,25	0,2	0,25
Loam ^a	0,4	0,2	0,4
Sand and gravel	0,65	0,2	0,65

^a At least of stiff consistency in accordance with ENV 1997-1.

The ballast need to be placed in such a way that it will be activated when lifting forces are applied. If the ballast is placed on the bottom level the use of Layher uprights with connected base collar is necessary.

2.0 General calculation input.

2.1 Information About the calculation program.

For the calculation of the construction the program RFem from Dlubal software GmbH has been used. The calculation of the Load cases has been made according to the Geometrically Linear analyses principle. The calculation of the Load combinations has been made according to the Large deformation analyse principle.

2.2 Construction model of the DJ roof 2018.

For the construction two models have been entered the program. The first model is for the In service situation, the second model is for the Out service situation in which the canopy has been removed.

In service model

Out service model

2.3 Different load cases.

For the calculation different load cases have been constructed in the program.

Load Case	Load Case Description	To Solve	EN 1990 CEN Action Category	Self-Weight - Factor in Direction	Active	X	Y	Z
LC1	Self-weight	+	Permanent	+	0,000	0,000	-1,000	
LC2	UDL loading front arch	+	Permanent/Imposed	-	0,000	0,000	0,000	
LC3	UDL loading back arch	+	Permanent/Imposed	-	0,000	0,000	0,000	
LC100	wind direction 0° In service	+	Wind	-	0,000	0,000	0,000	
LC101	wind direction 90° In service	+	Wind	-	0,000	0,000	0,000	
LC200	wind direction 0° Out service	+	Wind	-	0,000	0,000	0,000	
LC201	wind direction 90° Out service	+	Wind	-	0,000	0,000	0,000	

2.4 load case input

2.4.1 LC1 Self-Weight

Self-weight of the system is calculated by the program itself.

1.4.2 LC2 UDL Loading front arch

The loading which is taken into account in the UDL Loading setup are:

Front arch = 0.25 kN/m^{-1}

1.4.3 LC3 UDL Loading Back arch

The loading which is taken into account in the UDL Loading setup are:

Front arch = 0.25 kN/m^{-1}

2.5 Load cases concerning wing loading.

For the calculation of the wind loading the next wind coefficient are used. These factors are subtracted from the Eurocode NEN-EN 1991-1 1-4: general actions – wind actions and EN-AW-13814:

Fairground and amusement park machinery and structures safety

Wind from the front $C_f = 1.5$ for the roof

Wind from the side $C_f = 1.3$ for the roof

Wind on the stage for both directions $C_f = 1.3$

2.5.1 LC100 wind direction 0° In service.

Wind calculations Roof Membrane

$$q_{w, \text{roof}} = 1.5 * 0.2 * 1 = 0.30 \text{ kN/m}$$

Wind on stage.

$$q_{w, \text{stage}} = 1.3 * 0.2 * 2 / 2 = 0.26 \text{ kN/m}$$

These loads have been set on the top and the bottom ledger in the direction of the wind.

wind on truss Tubes.

On all tubes with measurement of 48mm which are exposed to the wind a loading has been set

$$q_{w, \text{profile 48 mm}} = 1 * 0.2 * 0.048 = 0.009 \text{ kN/m}$$

2.5.2 LC101 wind direction 90° In service.

Wind calculations Roof Membrane

$$q_{w, \text{roof}} = 1.3 * 0.2 * 1 = 0.26 \text{ kN/m}$$

Wind on stage.

$$q_{w, \text{stage}} = 1.3 * 0.2 * 2 / 2 = 0.26 \text{ kN/m}$$

These loads have been set on the top and the bottom ledger in the direction of the wind.

wind on truss Tubes.

On all tubes with measurement of 48mm which are exposed to the wind a loading has been set

$$q_{w, \text{profile 48 mm}} = 1 * 0.2 * 0.048 = 0.009 \text{ kN/m}$$

2.5.3 LC200 wind direction 0° Out service.

wind on truss and Layher.

On all tubes with measurement of 48mm which are exposed to the wind a loading has been set

$$q_{w, \text{profile } 48 \text{ mm}} = 1 * 0.4375 * 0.048 = 0.021 \text{ kN/m}$$

2.5.4 LC201 wind direction 90° Out service.

wind on truss and Layher.

On all tubes with measurement of 48mm which are exposed to the wind a loading has been set

$$q_{w, \text{profile } 48 \text{ mm}} = 1 * 0.4375 * 0.048 = 0.021 \text{ kN/m}$$

2.6 Load combinations and result combinations

Different load combinations have been generated in the program.

The calculation has been done according to the stress capacity calculation.

The partial safety factors are According to the EN 13814:2004 chapter 5.3.6.1

$\gamma_G = 1.1$ or 1.35 Partial safety factors for permanent actions

$\gamma_{k,i} = 1.35$ Partial safety factors for variable actions

The fundamental combinations are

$\Sigma \gamma_G G_k$ ($= \Sigma 1.35 * G_k$)

$\Sigma \gamma_G G_k + \Sigma \gamma_{k,i} Q_{k,i}$ ($= \Sigma 1.1 * G_k + \Sigma 1.35 * Q_{k,i}$)

G_k Characteristic value of permanent actions

$Q_{k,i}$ Characteristic value of one of the variable actions

The γ_G is set to 1.15 as an extra safety for all the small extra material which are used in the construction and which are not specific inserted in the Self-weight load case. These extra materials are for example retched straps, steel wire's, clamps....

2.6.1 load combinations.

2.8.3 Calculation summary for the Out service situation

	Description	Value	Unit	Comment
Summary				
	Calculation Status	OK		
	Maximum displacement in X-direction	11,3	mm	CO204, Member No. 822, x: 0.027 m
	Maximum displacement in Y-direction	-53,3	mm	CO204, Member No. 483, x: 0.000 m
	Maximum displacement in Z-direction	-64,6	mm	CO204, Member No. 483, x: 0.000 m
	Maximum vectorial displacement	84,1	mm	CO204, Member No. 483, x: 0.000 m
	Maximum rotation about X-axis	26,4	mrاد	CO204, Member No. 525, x: 0.000 m
	Maximum rotation about Y-axis	-32,7	mrاد	CO204, Member No. 4, x: 0.036 m
	Maximum rotation about Z-axis	11,4	mrاد	CO204, Member No. 412, x: 0.135 m
	Number of 1D finite elements (member elements)	2520		
	Number of 2D finite elements (surface elements)	1580		
	Number of 3D finite elements (solid elements)	0		
	Number of FE mesh nodes	3281		
	Number of equations	19686		
	Matrix solver method	Direct		
	Maximum number of iterations	100		
	Number of divisions for member results	10		
	Number of divisions of members with cable, elastic foundation, taper, or plastic characteristic	10		
	Activate shear stiffness of members (A-y, A-z)	+		
	Plate bending theory	Mindlin		
	Precision of convergence criteria of nonlinear calculation	1		

2.8.4 Calculation result of the separate load cases.

Description	Value	Unit	Comment
LC1 - Self-weight			
Sum of loads in X	0,00	kN	
Sum of support forces in X	0,00	kN	
Sum of loads in Y	0,00	kN	
Sum of support forces in Y	0,00	kN	
Sum of loads in Z	-11,23	kN	
Sum of support forces in Z	-11,23	kN	Deviation: 0.00 %
Resultant of reactions about X	0,004	kNm	At center of gravity of model (X: 0.003, Y: 0.211, Z: 0.406 m)
Resultant of reactions about Y	0,000	kNm	At center of gravity of model
Resultant of reactions about Z	0,000	kNm	At center of gravity of model
Maximum displacement in X-direction	0,7	mm	Member No. 829, x: 0.027 m
Maximum displacement in Y-direction	-7,6	mm	Member No. 481, x: 2.034 m
Maximum displacement in Z-direction	-14,7	mm	Member No. 481, x: 2.034 m
Maximum vectorial displacement	16,6	mm	Member No. 481, x: 2.034 m
Maximum rotation about X-axis	9,4	mrاد	Member No. 481, x: 5.084 m
Maximum rotation about Y-axis	-15,4	mrاد	Member No. 4, x: 0.027 m
Maximum rotation about Z-axis	-1,1	mrاد	Member No. 476, x: 0.135 m
Method of analysis	Large		Large Deformation Analysis (Newton-Raphson)
LC2 - UDL loading front arch			
Sum of loads in X	0,00	kN	
Sum of support forces in X	0,00	kN	
Sum of loads in Y	0,00	kN	
Sum of support forces in Y	0,00	kN	
Sum of loads in Z	-2,99	kN	
Sum of support forces in Z	-2,99	kN	Deviation: 0.00 %
Resultant of reactions about X	5,763	kNm	At center of gravity of model (X: 0.003, Y: 0.211, Z: 0.406 m)
Resultant of reactions about Y	0,001	kNm	At center of gravity of model
Resultant of reactions about Z	0,000	kNm	At center of gravity of model
Maximum displacement in X-direction	3,1	mm	Member No. 829, x: 0.027 m
Maximum displacement in Y-direction	-33,9	mm	Member No. 483, x: 0.000 m
Maximum displacement in Z-direction	-40,7	mm	Member No. 483, x: 0.000 m
Maximum vectorial displacement	52,9	mm	Member No. 483, x: 0.000 m
Maximum rotation about X-axis	16,6	mrاد	Member No. 570, x: 0.000 m
Maximum rotation about Y-axis	7,3	mrاد	Member No. 612, x: 0.146 m
Maximum rotation about Z-axis	-6,0	mrاد	Member No. 476, x: 0.135 m
Method of analysis	Large		Large Deformation Analysis (Newton-Raphson)
LC3 - UDL loading back arch			
Sum of loads in X	0,00	kN	
Sum of support forces in X	0,00	kN	
Sum of loads in Y	0,00	kN	
Sum of support forces in Y	0,00	kN	
Sum of loads in Z	-1,65	kN	
Sum of support forces in Z	-1,65	kN	Deviation: 0.00 %
Resultant of reactions about X	-1,977	kNm	At center of gravity of model (X: 0.003, Y: 0.211, Z: 0.406 m)
Resultant of reactions about Y	0,000	kNm	At center of gravity of model
Resultant of reactions about Z	0,000	kNm	At center of gravity of model
Maximum displacement in X-direction	-0,2	mm	Member No. 624, x: 0.175 m
Maximum displacement in Y-direction	7,6	mm	Member No. 483, x: 0.000 m
Maximum displacement in Z-direction	7,9	mm	Member No. 483, x: 0.000 m
Maximum vectorial displacement	10,9	mm	Member No. 483, x: 0.000 m
Maximum rotation about X-axis	-3,7	mrاد	Member No. 483, x: 0.000 m
Maximum rotation about Y-axis	-1,9	mrاد	Member No. 21, x: 0.000 m
Maximum rotation about Z-axis	1,3	mrاد	Member No. 299, x: 0.121 m
Method of analysis	Large		Large Deformation Analysis (Newton-Raphson)
LC200 - wind direction 0° out service			
Sum of loads in X	0,00	kN	
Sum of support forces in X	0,00	kN	
Sum of loads in Y	3,88	kN	
Sum of support forces in Y	3,88	kN	Deviation: 0.00 %
Sum of loads in Z	0,00	kN	
Sum of support forces in Z	0,00	kN	
Resultant of reactions about X	-2,461	kNm	At center of gravity of model (X: 0.003, Y: 0.211, Z: 0.406 m)
Resultant of reactions about Y	0,000	kNm	At center of gravity of model
Resultant of reactions about Z	-0,002	kNm	At center of gravity of model
Maximum displacement in X-direction	-0,4	mm	Member No. 829, x: 0.189 m
Maximum displacement in Y-direction	12,0	mm	Member No. 483, x: 0.000 m
Maximum displacement in Z-direction	12,0	mm	Member No. 483, x: 0.000 m
Maximum vectorial displacement	17,0	mm	Member No. 483, x: 0.000 m
Maximum rotation about X-axis	-4,7	mrاد	Member No. 592, x: 0.006 m
Maximum rotation about Y-axis	-5,9	mrاد	Member No. 6, x: 0.032 m
Maximum rotation about Z-axis	1,4	mrاد	Member No. 299, x: 0.161 m
Method of analysis	Large		Large Deformation Analysis (Newton-Raphson)
LC201 - wind direction 90° out service			
Sum of loads in X	3,70	kN	
Sum of support forces in X	3,70	kN	Deviation: 0.00 %
Sum of loads in Y	0,00	kN	
Sum of support forces in Y	0,00	kN	
Sum of loads in Z	0,00	kN	
Sum of support forces in Z	0,00	kN	
Resultant of reactions about X	0,000	kNm	At center of gravity of model (X: 0.003, Y: 0.211, Z: 0.406 m)
Resultant of reactions about Y	1,858	kNm	At center of gravity of model
Resultant of reactions about Z	0,249	kNm	At center of gravity of model
Maximum displacement in X-direction	5,7	mm	Member No. 513, x: 0.178 m
Maximum displacement in Y-direction	-0,7	mm	Member No. 626, x: 0.117 m
Maximum displacement in Z-direction	-0,4	mm	Member No. 527, x: 0.087 m
Maximum vectorial displacement	5,7	mm	Member No. 513, x: 0.149 m
Maximum rotation about X-axis	0,9	mrاد	Member No. 488, x: 0.000 m
Maximum rotation about Y-axis	1,8	mrاد	Member No. 1359, x: 0.000 m
Maximum rotation about Z-axis	1,6	mrاد	Member No. 870, x: 0.060 m
Method of analysis	Large		Large Deformation Analysis (Newton-Raphson)

2.8.5 Calculation result of RC1 - General loading without wind 1 * (CO1 – CO2)

Description	Value	Unit	Comment
CO1 - 1.15*LC1 + 1.35*LC2			
Sum of loads in X	0,00	kN	
Sum of support forces in X	0,00	kN	
Sum of loads in Y	0,00	kN	
Sum of support forces in Y	0,00	kN	
Sum of loads in Z	-16,95	kN	
Sum of support forces in Z	-16,95	kN	Deviation: 0.00 %
Maximum displacement in X-direction	5,0	mm	Member No. 829, x: 0.027 m
Maximum displacement in Y-direction	-53,2	mm	Member No. 483, x: 0.000 m
Maximum displacement in Z-direction	-64,5	mm	Member No. 483, x: 0.000 m
Maximum vectorial displacement	83,6	mm	Member No. 483, x: 0.000 m
Maximum rotation about X-axis	26,2	mrاد	Member No. 570, x: 0.000 m
Maximum rotation about Y-axis	-32,1	mrاد	Member No. 4, x: 0.036 m
Maximum rotation about Z-axis	-9,4	mrاد	Member No. 476, x: 0.135 m
Method of analysis	Large		Large Deformation Analysis (Newton-Raphson)
CO2 - 1.15*LC1 + 1.35*LC2 + 1.35*LC3			
Sum of loads in X	0,00	kN	
Sum of support forces in X	0,00	kN	
Sum of loads in Y	0,00	kN	
Sum of support forces in Y	0,00	kN	
Sum of loads in Z	-19,18	kN	
Sum of support forces in Z	-19,18	kN	Deviation: 0.00 %
Maximum displacement in X-direction	4,9	mm	Member No. 829, x: 0.027 m
Maximum displacement in Y-direction	-43,1	mm	Member No. 483, x: 0.000 m
Maximum displacement in Z-direction	-53,7	mm	Member No. 483, x: 0.000 m
Maximum vectorial displacement	68,9	mm	Member No. 483, x: 0.000 m
Maximum rotation about X-axis	21,4	mrاد	Member No. 570, x: 0.000 m
Maximum rotation about Y-axis	-28,7	mrاد	Member No. 4, x: 0.036 m
Maximum rotation about Z-axis	-7,9	mrاد	Member No. 476, x: 0.135 m
Method of analysis	Large		Large Deformation Analysis (Newton-Raphson)

2.8.5.1 Deformation of the RC2: General load combinations characteristic values.

2.8.5.2 Internal force diagram RC1 Design calculation general load combinations

RC 1: CO1 or CO2

Members Internal Forces V-z

Result Combinations: Max and Min Values

Isometric

Internal forces
V_z [kN]

Members Max V-z: 7.29, Min V-z: -8.02 [kN]

RC 1: CO1 or CO2

Members Internal Forces M-T

Result Combinations: Max and Min Values

Isometric

Internal forces
M_T [kNm]

Members Max M-T: 0.18, Min M-T: -0.17 [kNm]

RC 1: CO1 or CO2

Members Internal Forces M-y

Result Combinations: Max and Min Values

Isometric

Internal forces
M_y [kNm]Max: 1.26
Min: -0.74

Members Max M-y: 1.26, Min M-y: -0.74 [kNm]

RC 1: CO1 or CO2

Members Internal Forces M-z

Result Combinations: Max and Min Values

Isometric

Internal forces
M_z [kNm]Max: 0.34
Min: -0.34

Members Max M-z: 0.34, Min M-z: -0.34 [kNm]

2.8.6 Calculation result of RC5 - Design values Out-service: 1 * (CO200 – CO205)

Description	Value	Unit	Comment
CO200 - 1.15*LC1 + 1.35*LC200			
Sum of loads in X	0,00	kN	
Sum of support forces in X	0,00	kN	
Sum of loads in Y	5,23	kN	
Sum of support forces in Y	5,23	kN	Deviation: 0.00 %
Sum of loads in Z	-12,91	kN	
Sum of support forces in Z	-12,91	kN	Deviation: 0.00 %
Maximum displacement in X-direction	-0,8	mm	Member No. 1385, x: 1.440 m

2.9 Stress analyse calculation for the In service situation.

There are three stress analyse calculation made for the In service situation

CA1 - General loading without wind	: 1 * (CO1 or to CO2)
CA2 – Load cases wind direction 0°	: 1 * (CO100 or to CO102)
CA3 – Load cases wind direction 90°	: 1 * (CO103 or to CO105)

The Yield strength of material 3 has been manually changed. This is according to the Eurocode NEN-EN 1999-1-1 Table 3.2 the $f_{o,haz}$ for the heat affective zone. This check is concerning a welded construction with heat affective zones in the main elements, there for the choice to check the construction according to the lower $f_{o,haz}$.

2.10 Stress analyse calculation for the Out service situation.

There are three stress analyse calculation made for the Out service situation

CA1 - General loading without wind	: 1 * (CO1 or to CO2)
CA2 – Load cases wind direction 0°	: 1 * (CO200 or to CO202)
CA3 – Load cases wind direction 90°	: 1 * (CO203 or to CO205)

The Yield strength of material 3 has been manually changed. This is according to the Eurocode NEN-EN 1999-1-1 Table 3.2 the $f_{o,haz}$ for the heat affective zone. This check is concerning a welded construction with heat affective zones in the main elements, there for the choice to check the construction according to the lower $f_{o,haz}$.

3.0 Detail calculations for different parts.

The In service situation contents the decisive load combinations.

These load combinations show the highest internal forces, besides that are the Utilisations of the stress calculation in the In service situation higher then the Utilisation of the stress in the Out service situation.

3.1 Detail Check of Special Triangular truss.

3.1.1 special triangular truss model.

3.1.2 Truss main tube and coupling system

The truss coupling system is the same as the S41 truss of Interlat. According to the structural information of the S41 truss, the maximum normal force in the coupling system is 49.24 kN.

The decisive position is in the heat affective zone in the main tube just behind the weld of the coupler to the main tube.

Check of the main tube

The decisive result combination is RC3 – Design values In service wind

Internal forces diagrams for the complete truss in RC3

Result of the stress calculation CA2

Maximum utilisation = 99%

Maximum stress = 11.21 kN/cm² < 12.5 kN/cm²

3.1.3 Check of the Truss diagonals.

Result of the stress calculation CA3

Maximum utilisation = 54%

Maximum stress = 6.17 kN/cm² < 12.5 kN/cm²

3.2 Check of the pressure tube in the top of the roof.

Maximum normal force inside the Pressure tube.

Buckling calculation of the middle tube:

$$N_{ed} = 1.65 \text{ kN}$$

Buckling Length factor $K = 1.25$ table 6,8 NEN-EN 1999-1-1

$$L_{cr} = 1.25 * 508.5 = 636$$

$$\lambda_z = L_{cr} / (i_z * \pi) * \sqrt{(A_{eff} * f_0) / (A * E)}$$

$$\lambda_z = 636 / (1.63 * \pi) * \sqrt{((5.78 * 25) / (5.78 * 7000))} = 5.24$$

$$\Theta_z = 0.5 * (1 + \alpha * (\lambda_z - \lambda_0) + \lambda_z^2)$$

$$\Theta_z = 0.5 * (1 + 0.2 * (5.24 - 0.10) + 5.24^2) = 14.74$$

$$X_z = 1 / (\Theta_z + \sqrt{(\Theta_z^2 - \lambda_z^2)})$$

$$X_z = 1 / (14.74 + \sqrt{(14.74^2 - 5.24^2)}) = 0.04$$

$$N_{b,rd} = X_z * A * f_0 / 1.1$$

$$N_{b,rd} = 0.04 * 5.78 * 12.5 / 1.1 = 2.30 \text{ kN}$$

Check

$$N_{b,rd} / N_{ed} < 1$$

$$2.30 / 1.64 = 0.71 < 1$$

Buckling calculation of the side tube:

$$N_{ed} = 2.87 \text{ kN}$$

Buckling Length factor $K = 1.25$ table 6,8 NEN-EN 1999-1-1

$$L_{cr} = 1.25 * 375 = 469$$

$$\lambda_z = L_{cr} / (i_z * \pi) * \sqrt{((A_{eff} * f_0) / A * E)}$$

$$\lambda_z = 469 / (1.63 * \pi) * \sqrt{((5.78 * 25) / (5.78 * 7000))} = 3.86$$

$$\Theta_z = 0.5 * (1 + \alpha * (\lambda_z - \lambda_0) + \lambda_z^2)$$

$$\Theta_z = 0.5 * (1 + 0.2 * (3.86 - 0.10) + 3.86^2) = 8.34$$

$$X_z = 1 / (\Theta_z + \sqrt{(\Theta_z^2 - \lambda_z^2)})$$

$$X_z = 1 / (8.34 + \sqrt{(8.34^2 - 3.86^2)}) = 0.06$$

$$N_{b,rd} = X_z * A * f_0 / 1.1$$

$$N_{b,rd} = 0.06 * 5.78 * 12.5 / 1.1 = 4.17 \text{ kN}$$

Check

$$N_{b,rd} / N_{ed} < 1$$

$$4.17 / 2.87 = 0.69 < 1$$

The check of the corner has been done with the stress analyse calculation for the In service situation

3.3.2 Stress analyse CA2 –design values In-service

Maximum yield strength for different materials

Material = EN-AW-6082 T6

$f_{o,haz} = 12.5 \text{ kN/cm}^2$

The Yield strength for the material EN-AW-6082 T6, has been manually changed into $f_{o,haz}$, This is according to the Eurocode NEN-EN 1999-1-1 Table 3.2 the $f_{o,haz}$ for the heat affective zone. This check is concerning a welded construction with heat affective zones in the main elements, there for the choice to check the construction according to the lower $f_{o,haz}$.

Maximum Utilisation in the heat affected zone beside the weld to the square profile and the Main tube of the back arch.

Utilisation is 99%

3.3.3 Stress analyse calculation of the adapter plate.

Stress calculation in the head affected zone around the welded tube with maximum Normal force of the main tube from the truss

$$N_{ed, \max} = 22.35 \text{ kN}$$

$$\text{Shear Surface in heat affected zone} = \pi * 4.8 * 1.0 = 15.1 \text{ cm}^2$$

$$V_{rd} = 0.58 * 15.1 * 12.5 / 1.1 = 99.52 \text{ kN}$$

$$N_{ed, \max} / V_{rd} < 1$$

$$22.35 / 99.52 = 0.22 < 1$$

3.3.4 calculation of the surface pressure between the hinge construction and the pin

Shear force inside the pin in two directions

Check of the surface pressure in the hinge adapter

Total shear force

$$F_{b,Ed} = \sqrt{(V_y^2 + V_z^2)} = \sqrt{(16.82^2 + 11.84^2)} = 20.57 \text{ kN}$$

$$F_{b,Rd} = 1.5 * f_u * d * t / \gamma_{m2} = 1.5 * 27.5 * 2.0 * 1 / 1.25 = 66 \text{ kN}$$

Check

$$F_{b,Ed} / F_{b,Rd} < 1$$

$$20.57 / 66 = 0.31 < 1$$

Check of the surface pressure in the corner square profile

Total shear force

$$F_{b,Ed} = \sqrt{(V_y^2 + V_z^2)} = \sqrt{(16.82^2 + 11.84^2)} = 20.57 \text{ kN}$$

$$F_{b,Rd} = 1.5 * f_u * d * t / \gamma_{m2} = 1.5 * 31 * 2.0 * 0.4 / 1.25 = 29.76 \text{ kN}$$

Check

$$F_{b,Ed} / F_{b,Rd} < 1$$

$$20.57 / 29.76 = 0.69 < 1$$

3.4 Check of the S41 truss.

The check of the S41 truss has been done with the stress analyse calculation CA2 for the In service situation.

Stress analyse CA2 –design values In-service

Maximum yield strength for different materials

Material = EN-AW-6082 T6

$f_{0,haz} = 12.5 \text{ kN/cm}^2$

The Yield strength for the material EN-AW-6082 T6, has been manually changed into $f_{0,haz}$, This is according to the Eurocode NEN-EN 1999-1-1 Table 3.2 the $f_{0,haz}$ for the heat affective zone. This check is concerning a welded construction with heat affective zones in the main elements, there for the choice to check the construction according to the lower $f_{0,haz}$.

Maximum utilisation is 67%

Maximum stress = $7.58 \text{ kN/cm}^2 < 12.5 \text{ kN/cm}^2$

The S41 truss is stabilized by short aluminium 48x3 tubes which has a length of 0.5 meter and a maximum force of 5.64 kN

Utilisation on buckling = 9%

4.0 Calculation of the Layher System.

The staging system is built from the Layher scaffolding system. The type of Layher which is used in General is the k2000+ system. All the design figures which are taken into account in this calculation are taken from the k2000+ system.

4.1 RFem Layher stage Model

The Layher system is part of the main model and therefor all the reaction forces of the roof system are already in the model

4.5.2 result combination RC5 Design calculation Out-service situation.

Buckling calculation Layher pole Maximum Normal force

$$N_{ed} = 6.98 \text{ kN}$$

$$\text{Buckling Length factor } K = 0.9$$

The factor K is according to table 6,8 NEN-EN 1999-1-1

$$L = 200 \text{ cm}$$

$$L_{cr} = 0.9 * 200 = 162$$

$$I_y = \sqrt{I_y / A} = \sqrt{11.6 / 4.53} = 1.6$$

$$\lambda_z = L_{cr} / (i_z * \pi) * \sqrt{(A_{eff} * f_y) / (A * E)}$$

$$\lambda_z = 162 / (1.6 * \pi) * \sqrt{(4.27 * 35.5) / (4.27 * 21000)} = 1.32$$

$$\Theta_z = 0.5 * (1 + \alpha * (\lambda_z - \lambda_0) + \lambda_z^2)$$

$$\Theta_z = 0.5 * (1 + 0.49 * (1.32 - 0.10) + 1.32^2) = 1.65$$

$$X_z = 1 / (\Theta_z + \sqrt{(\Theta_z^2 - \lambda_z^2)})$$

$$X_z = 1 / (1.65 + \sqrt{1.65^2 - 1.32^2}) = 0.38$$

$$N_{b, RD} = X_z * A * f_0 / 1.1 = 0.38 * 4.27 * 32 / 1.1 = 47.21 \text{ kN}$$

check

$$N_{ed} / N_{b, RD} < 1$$

$$6.98 / 47.21 = 0.15 < 1$$

4.6 Detail check of horizontal ledgers.

Decisive result combination = RC3 design values In-service situation.

4.6.1 result combination RC3 Design calculation In-service situation.

Check of the horizontal ledgers

Maximum Normal force in a horizontal diagonal $N_{y,ed} = 3.57 \text{ kN}$

Maximum resistance design of a horizontal diagonal $N_{y,rd} = 31.0 \text{ kN}$

$$N_{y,ed} / N_{y,rd} < 1$$

$$3.57 / 31.0 = 0.12 < 1$$

4.7 Detail check of floor beam

Decisive result combination = RC3 design values In-service situation.

4.7.1 result combination RC3 Design calculation In-service situation.

Profiel berekening.

Layher Event Beam

speciaal profiel

Aluminium 6005A T6

$$W_y = I_y / e_y = 554 / 8.25 = 67.15 \text{ cm}^3$$

$$W_z = I_z / e_z = 70.2 / 2.5 = 28.08 \text{ cm}^3$$

Due to the low internal forces no further proof necessary.

4.8 Detail check of the Layher spindles.

Decisive result combination = RC3 design values In-service situation.

4.8.1 result combination RC3 Design calculation In-service situation.

Check of the Layher screw jack.

Maximum Normal force in a Layher screw jack $N_{y,ed} = 7.36 \text{ kN}$

Maximum horizontal force in this Layher screw jack $V_{y,ed} = \sqrt{(0.48^2 + 0.60^2)} = 0.76 \text{ kN}$

According to the table 12 from the Layher technical information catalogue, a Screw jack with a horizontal load of 0.76 kN and a vertical load of 7.36 kN can have a maximum spindle length of 37cm.

*Die zulässigen Vertikallasten wurden berechnet unter Anwendung des Berechnungsmodells nach DIN EN 12811-1, Abs. 10.2.3.2.
Zur Erfassung der Biegesteifigkeit des Ständerrohres, der Schnittgrößenanteile aus Theorie II. Ordnung und der maximalen Beanspruchbarkeit der Ständer wurden folgende Raumgüste mit Rastermaß 2,57 x 2,57 m berücksichtigt:
2,00 m Lagenhöhe für Stieldruckkräfte $N_1 \leq 39$ kN
1,50 m Lagenhöhe für Stieldruckkräfte 39 kN < $N_2 \leq 54$ kN

(–) Bei dieser Kombination von Ausspindellänge und Horizontallast ist die Biegebeanspruchbarkeit der Spindel überschritten.

4.9 Detail check of the Layher base adapter.

Decisive result combination = RC3 design values In-service situation.

The check of the Layher base has been done with the stress analyse calculation CA2 for the In service situation.

Maximum utilisation = 45%

Maximum stress = 11.21 kN/cm² < 23.5 kN/cm²

Check of the Layher coupler to the upright.

Maximum transversal force at the coupling = 3.67 kN.

According to the information of the Layher system the maximum transversal force of the coupler is 26.4 kN.

Vertikale Querkraft

Vertikale Querkraft, Einzelanschluss

$$V_{z, Rd} = \pm 26,4 \text{ kN}$$

Vertikale Querkraft je Lochscheibe

$$\sum V_{z, Rd} = \pm 105,6 \text{ kN}$$

5.0 Ballast and support load calculations.

5.1 General information Ballast calculation.

The ballast will be checked for uplift, overturning and sliding. The Layher stage which is designed as a ridged stage will be taken into account.

All permanent installed loading can be subtracted from the nearest Ballast position.

The safety factor for the ballast calculation against slipping is set to 1.2 according to the NEN-EN 13814. This is based on a horizontal load which is relying on friction.

For the friction coefficient the factor of 0.4 has been taken into account according to the table below.

Table 3 — Coefficients of friction μ

	Wood	Steel	Concrete
Wood	0,4	0,4	0,6
Steel	0,4	0,1	0,2
Concrete	0,6	0,2	0,5
Clay ^a	0,25	0,2	0,25
Loam ^a	0,4	0,2	0,4
Sand and gravel	0,65	0,2	0,65

^a At least of stiff consistency in accordance with ENV 1997-1.

The ballast need to be placed in such a way that it will be activated when lifting forces are applied. If the ballast is placed on the bottom level the use of Layher uprights with connected base collar is necessary.

5.2 Ballast configuration

5.3 Ballast calculation against uplift.

For the uplift ballast calculation, the total uplift forces will be taken into account and divide over two positions on each side. The relatively small Layher stage is a structurally stiff system and will work as one system.

5.3.1 Lifting forces RC3 -characteristic values In-service

The load combinations CO150, CO103 are decisive. These load cases have only self-weight, wind loading and no live load.

The self-weight of the system is already taken into account in the different calculations. The values are the actual values which need to be secured against ballast. The safety factor γ against overturning sliding and lifting are taken from table 2 of the EN-13814

For the uplift the $\gamma = 1.2$

Check Load combination CO150

Total amount of uplift force

Sum of loads in Z – Self-Weight = uplift force

$$4.27 - 11.27 = 7.00 \text{ kN}$$

Ballast check

$$(\text{self-weight}) / \text{Uplift force} > 1.2$$

$$11.27 / 7.00 = 1.61 > 1.2$$

Check Load combination CO153

Total amount of uplift force

Sum of loads in Z – Self-Weight = uplift force

$$11.29 - 11.27 = 0.02 \text{ kN}$$

Ballast check

self-weight / Uplift force > 1.2

$$0.02 / 7.00 > 1.2$$

5.4 Calculation of the system against overturning.

Results loading from the RFem model of the main construction for the different load combinations.

Description	Value	Unit	Description	Value	Unit

Sum of loads in X	4,19	kN	Sum of loads in X	3,70	kN
Sum of loads in Y	0,00	kN	Sum of loads in Y	0,00	kN
Sum of loads in Z	-15,94	kN	Sum of loads in Z	-15,87	kN

Decisive load combination CO50

CO50

Sum of load in Y direction = 5.92 kN

Sum of load in Z direction = -4.27 kN

Ballast = 7.00 kN per base unit

Overturning moment

$$M_{ov} = (5.92 \cdot 3) + ((4.27 - 11.27) \cdot 4.144 / 2) =$$

$$M_{ov} = 17.76 + 14.5 = 32.26 \text{ kNm}$$

Stabilization moment

$$M_{stab} = (2 \cdot 7 \cdot 2.072) + (11.27 \cdot 4.144 / 2)$$

$$M_{stab} = 29 + 23.35 = 52.36 \text{ kNm}$$

$$M_{stab} / M_{ov} = 52.36 / 32.26 = 1.62 > 1.2$$

5.5 Ballast calculation against slipping.

Decisive load combination is CO150

Ballast requirement with $\mu = 0.4$ Steel-wood-concrete/sand/gravel

Horizontal force = 5.92 kN

Total vertical force = 4.27 kN

Ballast = 7.00 kN per base unit

Check

$(\text{total vertical force} + \text{ballast}) * \text{friction coefficient} / \text{Horizontal Force} > 1.2$

$(4.27 + 14) * 0.4 / 5.92 = 1.23 > 1.2$
